

## TitraLube TAN and TBN Questions and Answers

1) What is the difference between the TAN and TBN test kits?

Answer: The TitraLube TAN kits are used to determine the oxidation (acid buildup) of lubricating/industrial oils, such as pump oils, hydraulic fluids, turbine oils. The TitraLube TBN kits are designed to measure the reserve alkalinity of lubricating oils used in large diesel engines.

2) What do the kit results mean?

Answer: The manufacturer or distributor of the oil should be able to provide you with recommendations regarding the useful life of the oil. The kits aid in monitoring the oil condition per the manufacturer's guidelines.

3) Can these kits be used to test synthetic oils?

Answer: Yes.
